NAME

extractres − filter to extract resources from a PostScript document

SYNOPSIS

extractres [**−m**] < *document.ps* > *output.ps*

DESCRIPTION

Extractres extracts resources (fonts, procsets, patterns, files, etc) appearing in a PostScript document, and puts appropriate *%%IncludeResource* comments in the document prologue. The extracted resources are written to files with the same name as the resource, and an appropriate extension. The pipeline

extractres file.ps | includeres >out.ps

will move all resources appearing in a document to the document prologue, removing redundant copies. The output file can then be put through page re-arrangement filters such as *psnup* or *pstops* safely.

The **−m** option combines the resources of the same name into one file; this must be used for some programs which download fonts a bit at a time.
